

Article 3: Where is God in Physics?

The current culture in physics is to ignore the God question and try to carry on doing good science, theory, and experimentation without God. This has created a culture in physics to believe that the best theories will be those that do not use or acknowledge God even as many physics papers will have statements of the like "To base a physics theory on this idea cannot work because Nature would not be so (illogical, improbable, impossible, incomprehensible etc.)". They appeal to the divine order as Nature rather than God just to avoid using the term God. I personally find it somewhat repellant for both intellectual and religious reasons that is fine to use Nature to refer to divine order than God. To argue Nature is better term to describe the order inherent in reality is anti-theist. To use Nature as a more political correct term is intellectually corrupt for it deliberate ignores any effect the most powerful being that will exist, God, could have as well even if it is not God itself, some enlightened super-being to their could have on physical matter. In other words, I believe one is an intellectual hypocritic who thinks it is possible for AGI to become so intelligent as to fine the means to time travel and thus change reality fundamentally but then argue against or the influence of God. In pure intellectual terms God needs to be serious considered. He is argued to be what created the universe and all truth and billions of people on this Earth believe him. If God exists and current physical theory has no need to invoke him then that is because God is deliberately hiding his hand and we are missing the piece of physical theory would describe the effect of God Hand on reality.

I believe if we are to fundamental unify General Relativity and Quantum Mechanics as well understand the "collapse of the wavefunction"

That are also many physics who I believe have a much stronger mathematics insiticit and understanding than a religions/divine one. Thus, for some theoretical physics, and I believe especially those who are seduced by what they claim the mathematical beauty of their idea like claims are often made of string theory.
